8.2	EVPPI	31
8.3	Summary	31

1 Overview

This report presents the results of an Expected Value of Partially Perfect Information (EVPPI) analysis for the METIMMOX-1 decision-analytic model. The analysis evaluates the value of reducing uncertainty in individual model parameters across multiple scenarios with varying willingness-to-pay (WTP) thresholds and nivolumab drug costs.

The Expected Value of Partially Perfect Information (EVPPI) quantifies the value of eliminating uncertainty in specific model parameters. It represents the maximum amount that should be paid for additional research to perfectly inform a particular parameter. EVPI (Expected Value of Perfect Information) represents the value of eliminating all uncertainty, and EVPPI for any parameter cannot exceed total EVPI.

Table 1: Analysis scenario definitions. Higher WTP thresholds (€100,000 and €150,000) are arbitrary exploratory thresholds, though the highest severity adjustment in Norwegian guidelines may fall between these values. The decreased nivolumab cost (€4,641) represents an 80% discount compared to the 40% discount in the base case scenario.

Scenario Name	WTP Threshold	Nivolumab Cost
Base Case	€ 51,000	€13,923
Decreased Nivolumab Cost	€ 51,000	€ 4,641
WTP €100,000	€100,000	€13,923
WTP €100,000 + Decreased Nivolumab	€100,000	€ 4,641
WTP €150,000	€150,000	€13,923
WTP €150,000 + Decreased Nivolumab	€150,000	€ 4,641

2 Base Case Scenario

Willingness-to-Pay Threshold: €51,000

Nivolumab Cost: €13,923

Figure 1: Cost-effectiveness scatter plot (base case)

Figure 2: Incremental cost-effectiveness scatter plot relative to control (base case)

Table 2: Cost-effectiveness analysis summary from probabilistic sensitivity analysis (base case)

Strategy	Mean Cost (€)	SD Cost	Mean Effect (QALYs)	SD Effect	Mean NMB (€)	SD NMB
control	€21,758.31	€ 2,856.78	1.805	0.192	€ 70,298.68	€10,236.61
crp	€56,086.29	€ 7,638.79	1.916	0.205	€ 41,632.78	€13,019.74
tlr	€76,586.70	€12,026.29	1.297	0.137	€-10,462.25	€13,963.40
tmb_braf	€68,154.60	€ 9,745.35	1.824	0.197	€ 24,872.44	€14,058.86

Figure 3: Net Monetary Benefit distribution (base case)

Figure 4: Cost-effectiveness acceptability curves (base case)

Total EVPI: €0

The EVPI is effectively zero, indicating no decision uncertainty at the base case WTP threshold. In this case, one strategy is clearly dominant regardless of parameter uncertainty, making EVPPI calculations less meaningful for the base case scenario.

3 Scenario 1: Decreased Nivolumab Cost

Willingness-to-Pay Threshold: €51,000

Nivolumab Cost: €4,641 (80% discount)

Figure 5: Cost-effectiveness scatter plot (Scenario 1)

Figure 6: Incremental cost-effectiveness scatter plot relative to control (Scenario 1)

Table 3: Cost-effectiveness analysis summary (Scenario 1)

8.3 Summary

Table 12: Summary of EVPI and top EVPPI by scenario

Scenario	WTP	EVPI	Top Parameter	Max EVPPI	% of EVPI
Decreased Nivolumab Cost	€ 51,000	€4.01	c_drug_nivo	€4.01	100
WTP €100,000 + Decreased Nivolumab	€100,000	€1081.33	c_test_CT	€1081.33	100
WTP €150,000	€150,000	€6.02	c_drug_nivo	€6.02	100
WTP €150,000 + Decreased Nivolumab	€150,000	€273.11	c_drug_nivo	€273.11	100

Scenario with Greatest Decision Uncertainty: WTP €100,000 + Decreased Nivolumab (EVPI = €1081.33)

Most Important Parameter Across All Scenarios: u_np (Total EVPPI = €1364.48)

Impact of WTP Threshold: Higher WTP thresholds generally increase decision uncertainty (EVPI), creating greater value for additional research to reduce parameter uncertainty.

Impact of Nivolumab Cost: Decreased nivolumab costs shift the cost-effectiveness landscape and may change which parameters drive decision uncertainty.
