1 Overview

This scenario analysis examines the impact of utility assumptions on the cost-effectiveness of biomarker-guided immunotherapy strategies for metastatic MSS/pMMR colorectal cancer.

1.1 Utility Scenarios

We compare three utility scenarios:

1. **Base Case:** Standard utility values ($u_{np} = 0.9077$, $u_p = 0.9005$)
2. **Scenario 1 - Unadjusted Life Years:** All utilities set to 1.0 (no quality adjustment)
3. **Scenario 2 - Alternative Utilities:** Lower utility values ($u_{np} = 0.73$, $u_p = 0.59$)

1.2 Model Structures

Each scenario is analyzed using three alternative model structures for the survival analysis:

Table 1: Model Structures for Survival Analysis

Model	Name	Formula Pattern	Description
Model A	Joint (All-in-One)	Age + sex + Rx + crp:Rx + tlr:Rx + tmb_braf:Rx	All biomarkers and all treatment interactions in a single model
Model B	Focused	Age + sex + Rx + crp + tlr + tmb_braf + [biomarker]:Rx	All biomarkers as main effects, one treatment interaction per model
Model C	Separate	Age + sex + Rx + [biomarker]:Rx	Only one biomarker and its treatment interaction per model

For each scenario, we present deterministic cost-effectiveness results comparing all three model structures, followed by probabilistic sensitivity analysis.

2 Base Case: Standard Utility Values

This analysis uses standard utility values derived from the IPD dataset ($u_{np} = 0.9077$, $u_p = 0.9005$).

Table 2: Base Case Utility Parameter Values

Parameter	Value	Description
u_{np} (Non-progressed utility)	0.9077	Utility value in non-progressed disease state
u_p (Progressed utility)	0.9005	Utility value in progressed disease state

2.1 Multi-Model Comparison

Table 3: Base Case Cost-Effectiveness Results by Model Structure

Strategy	Model A: Joint			Model B: Focused			Model C: Separate		
	Cost (A)	QALY (A)	ICER (A)	Cost (B)	QALY (B)	ICER (B)	Cost (C)	QALY (C)	ICER (C)
Standard of Care	\$20,894	1.844	Reference	\$20,894	1.844	Reference	\$20,894	1.844	Reference
CRP-guided	\$54,898	1.784	\$1,690,480	\$54,898	1.784	\$1,690,480	\$54,898	1.784	\$1,690,480
TLR-guided	\$84,974	1.704	Reference	\$84,974	1.704	Reference	\$84,974	1.704	Reference
TMB/BRAF-guided	\$63,560	1.870	Reference	\$63,560	1.870	Reference	\$63,560	1.870	Reference

Table 4: Optimal Strategy by Model Structure - Base Case

Model Structure	Optimal Strategy	NMB at WTP=\$51,000
Model A: Joint	Standard of Care	\$73,168
Model B: Focused	Standard of Care	\$73,168
Model C: Separate	Standard of Care	\$73,168

2.2 Cost-Effectiveness Planes

Figure 1: Cost-Effectiveness Planes by Model Structure - Base Case

2.3 Probabilistic Sensitivity Analysis (Model A)

PSA results are presented for Model A (Joint) only, as this is the primary model structure. The deterministic results above show comparison across all three model structures.

Table: PSA Summary Statistics - Base Case (Model A)

Table 5: PSA Summary - Base Case (Model A: Joint)

Strategy	meanCost	meanEffect	sdCost	sdEffect
control	21123.73	1.70	2897.52	0.33
crp	54804.87	1.81	8973.42	0.27
tlr	85012.26	1.76	16864.15	0.31
tmb_braf	63212.21	1.93	10768.22	0.36

Figure 2: PSA Scatterplot - Base Case (Model A: Joint)

Figure 3: Cost-Effectiveness Acceptability Curve - Base Case (Model A: Joint)

3 Scenario 1: Unadjusted Life Years (All Utilities = 1.0)

In this scenario, we analyze life years gained without quality-of-life adjustments, providing insight into the survival benefit independent of quality-of-life considerations.

Table 6: Utility Parameter Modifications for Scenario 1

Parameter	Base Case	Scenario 1	Difference
u_np (Non-progressed utility)	0.9077	1	0.0923
u_p (Progressed utility)	0.9005	1	0.0995

3.1 Multi-Model Comparison

Table 7: Scenario 1 Cost-Effectiveness Results by Model Structure (Unadjusted Life Years)

Strategy	Model A: Joint			Model B: Focused			Model C: Separate		
	Cost (A)	LY (A)	ICER (A)	Cost (B)	LY (B)	ICER (B)	Cost (C)	LY (C)	ICER (C)
Standard of Care	\$20,894	2.041	Reference	\$20,894	2.041	Reference	\$20,894	2.041	Reference
CRP-guided	\$54,898	1.972	\$1,625,936	\$54,898	1.972	\$1,625,936	\$54,898	1.972	\$1,625,936
TLR-guided	\$84,974	1.883	Reference	\$84,974	1.883	Reference	\$84,974	1.883	Reference
TMB/BRAF-guided	\$63,560	2.067	Reference	\$63,560	2.067	Reference	\$63,560	2.067	Reference

Table 8: Optimal Strategy by Model Structure - Scenario 1

Model Structure	Optimal Strategy	NMB at WTP=\$51,000
Model A: Joint	Standard of Care	\$83,203
Model B: Focused	Standard of Care	\$83,203
Model C: Separate	Standard of Care	\$83,203

3.2 Cost-Effectiveness Planes

Figure 4: Cost-Effectiveness Planes by Model Structure - Scenario 1 (Unadjusted Life Years)

3.3 Probabilistic Sensitivity Analysis (Model A)

PSA results are presented for Model A (Joint) only.

Table: PSA Summary Statistics - Scenario 1 (Model A)

Table 9: PSA Summary - Scenario 1 (Model A: Joint, Unadjusted Life Years)

Strategy	meanCost	meanEffect	sdCost	sdEffect
control	21158.99	1.89	2912.19	0.29
crp	55041.01	2.00	9185.94	0.20
tlr	85311.16	1.94	16662.82	0.26
tmb_braf	63428.30	2.14	10955.90	0.33

Figure 5: PSA Scatterplot - Scenario 1 (Model A: Joint, Unadjusted Life Years)

Figure 6: Cost-Effectiveness Acceptability Curve - Scenario 1 (Model A: Joint)

4 Scenario 2: Alternative Utility Values ($u_{np} = 0.73$, $u_p = 0.59$)

This scenario examines the cost-effectiveness under alternative, lower utility assumptions that may reflect more conservative estimates of quality of life. They are derived from the EQ-5D index score of the CORRECT trial (Grothey et al. Lancet 2013, as cited by Gourzoulidis et al. J Comp Effect Res 2018)-

Table 10: Utility Parameter Modifications for Scenario 2

Parameter	Base Case	Scenario 2	Difference	% Change
u_{np} (Non-progressed utility)	0.9077	0.73	-0.1777	-19.5770
u_p (Progressed utility)	0.9005	0.59	-0.3105	-34.4808

Beta Distribution Parameters for PSA:

Table 11: Beta Distribution Parameters for Scenario 2 PSA

Parameter	Mean	CV	Alpha	Beta
u_{np}	0.73	0.15	11.270	4.168
u_p	0.59	0.15	17.632	12.253

4.1 Multi-Model Comparison

Table 12: Scenario 2 Cost-Effectiveness Results by Model Structure (Alternative Utilities)

Strategy	Model A: Joint			Model B: Focused			Model C: Separate		
	Cost (A)	QALY (A)	ICER (A)	Cost (B)	QALY (B)	ICER (B)	Cost (C)	QALY (C)	ICER (C)
Standard of Care	\$20,894	1.327	Reference	\$20,894	1.327	Reference	\$20,894	1.327	Reference
CRP-guided	\$54,898	1.325	\$912,260	\$54,898	1.325	\$912,260	\$54,898	1.325	\$912,260

TMB/BRAF-guided	\$63,560	1.374	Reference	\$63,560	1.374	Reference	\$63,560	1.374	Reference

Table 13: Optimal Strategy by Model Structure - Scenario 2

Model Structure	Optimal Strategy	NMB at WTP=\$51,000
Model A: Joint	Standard of Care	\$46,795
Model B: Focused	Standard of Care	\$46,795
Model C: Separate	Standard of Care	\$46,795

4.2 Cost-Effectiveness Planes

Figure 7: Cost-Effectiveness Planes by Model Structure - Scenario 2 (Alternative Utilities)

4.3 Probabilistic Sensitivity Analysis (Model A)

PSA results are presented for Model A (Joint) only.

Table: PSA Summary Statistics - Scenario 2 (Model A)

Table 14: PSA Summary - Scenario 2 (Model A: Joint, Alternative Utilities)

Strategy	meanCost	meanEffect	sdCost	sdEffect
control	21134.61	1.25	2871.90	0.23
crp	54965.64	1.35	9299.52	0.20
tlr	85420.35	1.31	17037.60	0.23
tmb_braf	63506.36	1.42	11210.41	0.26

Figure 8: PSA Scatterplot - Scenario 2 (Model A: Joint, Alternative Utilities)

Figure 9: Cost-Effectiveness Acceptability Curve - Scenario 2 (Model A: Joint)

5 Comparative Analysis Across All Scenarios

5.1 Utility Parameter Summary

Table 15: Utility Parameter Values Across Scenarios

Scenario	u_np	u_p	Description
Base Case	0.9077	0.9005	Standard utility values from literature
Scenario 1 (Life Years)	1.0000	1.0000	No quality adjustment (all utilities = 1.0)
Scenario 2 (Alternative)	0.7300	0.5900	Lower/conservative utility estimates

5.2 Cross-Model, Cross-Scenario Optimal Strategy Comparison

`\begin{table}[H]`

`\caption{Optimal Strategy by Scenario and Model Structure (WTP = $51,000)}`

Scenario	Model A: Joint	Model B: Focused	Model C: Separate
Base Case	Standard of Care	Standard of Care	Standard of Care
Scenario 1	Standard of Care	Standard of Care	Standard of Care
Scenario 2	Standard of Care	Standard of Care	Standard of Care

`\end{table}`

5.3 Model A Results Across Scenarios

The following tables and plots compare results across scenarios for Model A (Joint), which is the primary model structure.

Table 16: Cost-Effectiveness Results Comparison Across Scenarios (Model A)

Scenario	Strategy	Cost (EUR)	Effect	NMB (EUR)
Base Case	Standard of Care	\$20,894	1.844	\$73,168
	CRP-guided	\$54,898	1.784	\$36,111
	TLR-guided	\$84,974	1.704	\$1,920
	TMB/BRAF-guided	\$63,560	1.870	\$31,789
Scenario 1	Standard of Care	\$20,894	2.041	\$83,203
	CRP-guided	\$54,898	1.972	\$45,698
	TLR-guided	\$84,974	1.883	\$11,054
	TMB/BRAF-guided	\$63,560	2.067	\$41,876
Scenario 2	Standard of Care	\$20,894	1.327	\$46,795
	CRP-guided	\$54,898	1.325	\$12,671
	TLR-guided	\$84,974	1.271	-\$20,144
	TMB/BRAF-guided	\$63,560	1.374	\$6,514

Figure 10: Comparison of Effects Across Scenarios by Strategy (Model A)

Table 17: ICER Comparison Across Scenarios - Model A (EUR per QALY/Life Year)

Strategy	Base Case	Scenario 1	Scenario 2
Standard of Care	Reference	Reference	Reference
TMB/BRAF-guided	\$1,690,480	\$1,625,936	\$912,260
CRP-guided	Reference	Reference	Reference
TLR-guided	Reference	Reference	Reference

Figure 11: Net Monetary Benefit Comparison Across Scenarios (Model A, WTP = EUR 51,000)

6 Robustness Assessment

6.1 Cross-Model Consistency

Table 18: Robustness of Optimal Strategy Across Model Structures

Scenario	Model Consistency	Optimal Strategy(ies)
Base Case	Consistent	Standard of Care
Scenario 1	Consistent	Standard of Care
Scenario 2	Consistent	Standard of Care

Robust Conclusion: The optimal strategy is consistent across all three model structures within each scenario, suggesting the conclusions are robust to the choice of survival model specification.

6.2 Cross-Scenario Consistency

Table 19: Sensitivity of Optimal Strategy to Utility Assumptions by Model

Model Structure	Scenario Consistency	Optimal Strategy(ies)
Model A: Joint	Consistent	Standard of Care
Model B: Focused	Consistent	Standard of Care
Model C: Separate	Consistent	Standard of Care

7 Summary

This scenario analysis examined the impact of utility assumptions on the METIMMOX-1 cost-effectiveness model across three alternative model structures:

- **Model A (Joint):** All biomarkers and all treatment interactions in a single model
- **Model B (Focused):** All biomarkers as main effects, one treatment interaction per model
- **Model C (Separate):** Only one biomarker and its treatment interaction per model

Key findings:

1. **Deterministic results:** Multi-model comparison tables show how cost-effectiveness results vary across model structures within each scenario.
2. **Cross-model robustness:** The robustness assessment above indicates whether the optimal strategy is consistent across model structures.
3. **Scenario sensitivity:** The cross-scenario consistency analysis shows how sensitive conclusions are to utility assumptions for each model structure.
4. **PSA results:** Probabilistic sensitivity analysis was conducted for Model A (Joint) across all three scenarios to characterize decision uncertainty.
