4	Scenario 2: Alternative Utility Values ($u_{np} = 0.73$, $u_p = 0.59$)	8
5	Comparative Analysis Across All Scenarios	12
6	Summary	15

1 Overview

This scenario analysis examines the impact of utility assumptions on the cost-effectiveness of biomarker-guided immunotherapy strategies for metastatic MSS/pMMR colorectal cancer. We compare three scenarios:

1. **Base Case:** Standard utility values ($u_{np} = 0.9077$, $u_p = 0.9005$)
2. **Scenario 1 - Unadjusted Life Years:** All utilities set to 1.0 (no quality adjustment)
3. **Scenario 2 - Alternative Utilities:** Lower utility values ($u_{np} = 0.73$, $u_p = 0.59$)

For each scenario, we present deterministic cost-effectiveness results with ICERs and probabilistic sensitivity analysis results.

2 Base Case: Standard Utility Values

This analysis uses standard utility values derived from the IPD dataset ($u_{np} = 0.9077$, $u_p = 0.9005$).

Table 1: Base Case Utility Parameter Values

Parameter	Value	Description
u_{np} (Non-progressed utility)	0.9077	Utility value in non-progressed disease state
u_p (Progressed utility)	0.9005	Utility value in progressed disease state

Table 2: Base Case Cost-Effectiveness Results

Strategy	Cost	Effect	Inc_Cost	Inc_Effect	ICER	Status
control	\$20,706	1.844	NA	NA	NA	ND
tmb_braf	\$62,246	1.870	41540.41	0.0252389	\$1,645,887	ND
crp	\$54,636	1.784	NA	NA	NA	D
tlr	\$84,730	1.704	NA	NA	NA	D

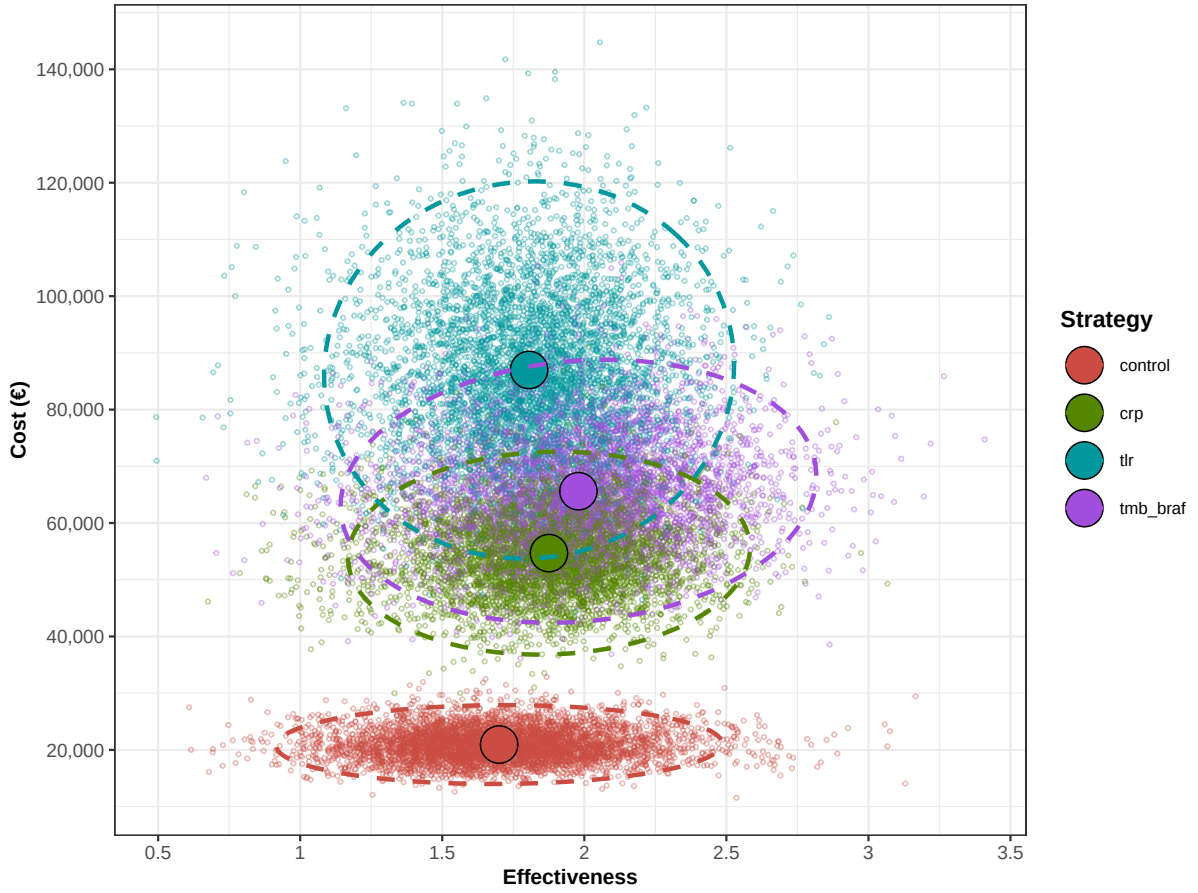

Figure 2: PSA Scatterplot - Base Case

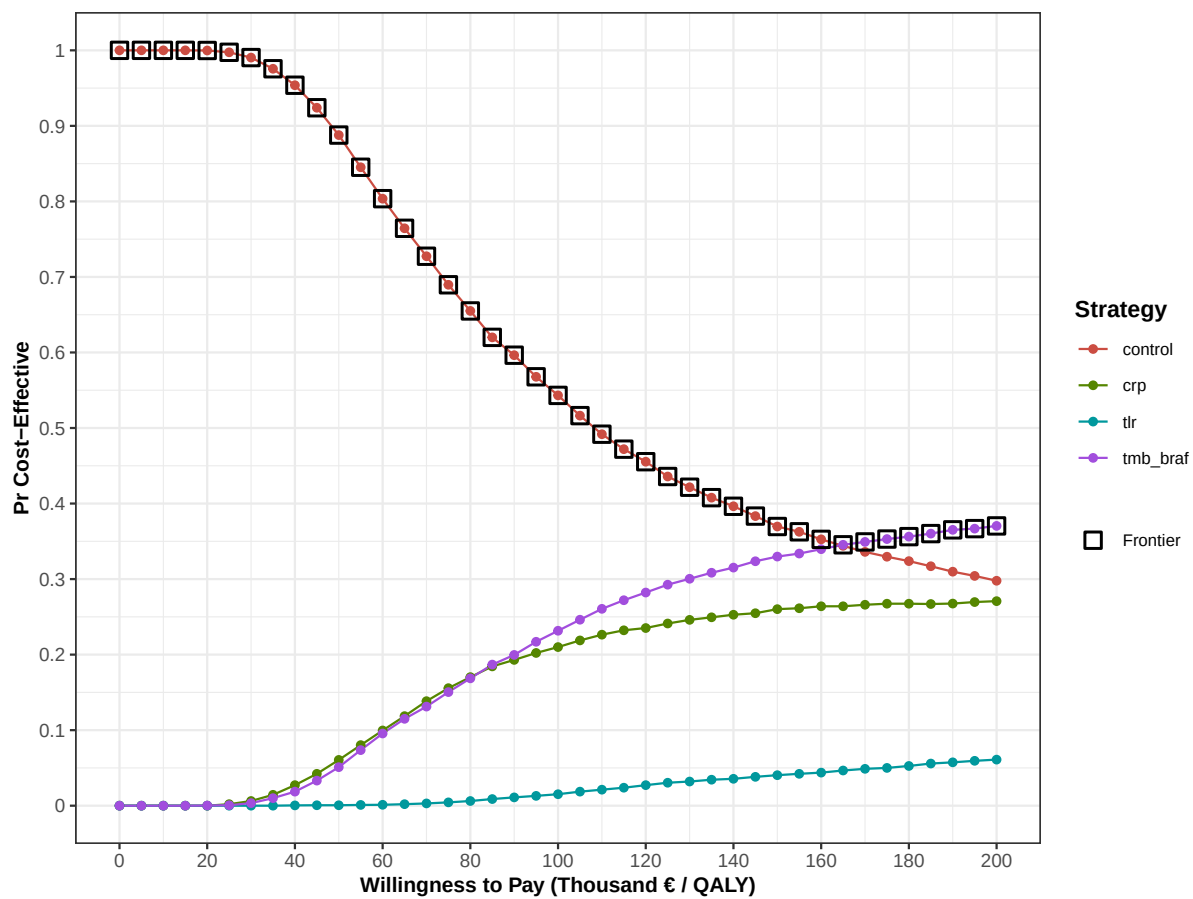

Figure 3: Cost-Effectiveness Acceptability Curve - Base Case

3 Scenario 1: Unadjusted Life Years (All Utilities = 1.0)

In this scenario, we analyze life years gained without quality-of-life adjustments, providing insight into the survival benefit independent of quality-of-life considerations.

Table 4: Utility Parameter Modifications for Scenario 1

Parameter	Base Case	Scenario 1	Difference
u_np (Non-progressed utility)	0.9077	1	0.0923
u_p (Progressed utility)	0.9005	1	0.0995

Table 5: Scenario 1 Cost-Effectiveness Results (Unadjusted Life Years)

Strategy	Cost	Effect	Inc_Cost	Inc_Effect	ICER	Status
control	\$20,706	2.041	NA	NA	NA	ND
tmb_braf	\$62,246	2.067	41540.41	0.0262408	\$1,583,045	ND
crp	\$54,636	1.972	NA	NA	NA	D
tlr	\$84,730	1.883	NA	NA	NA	D

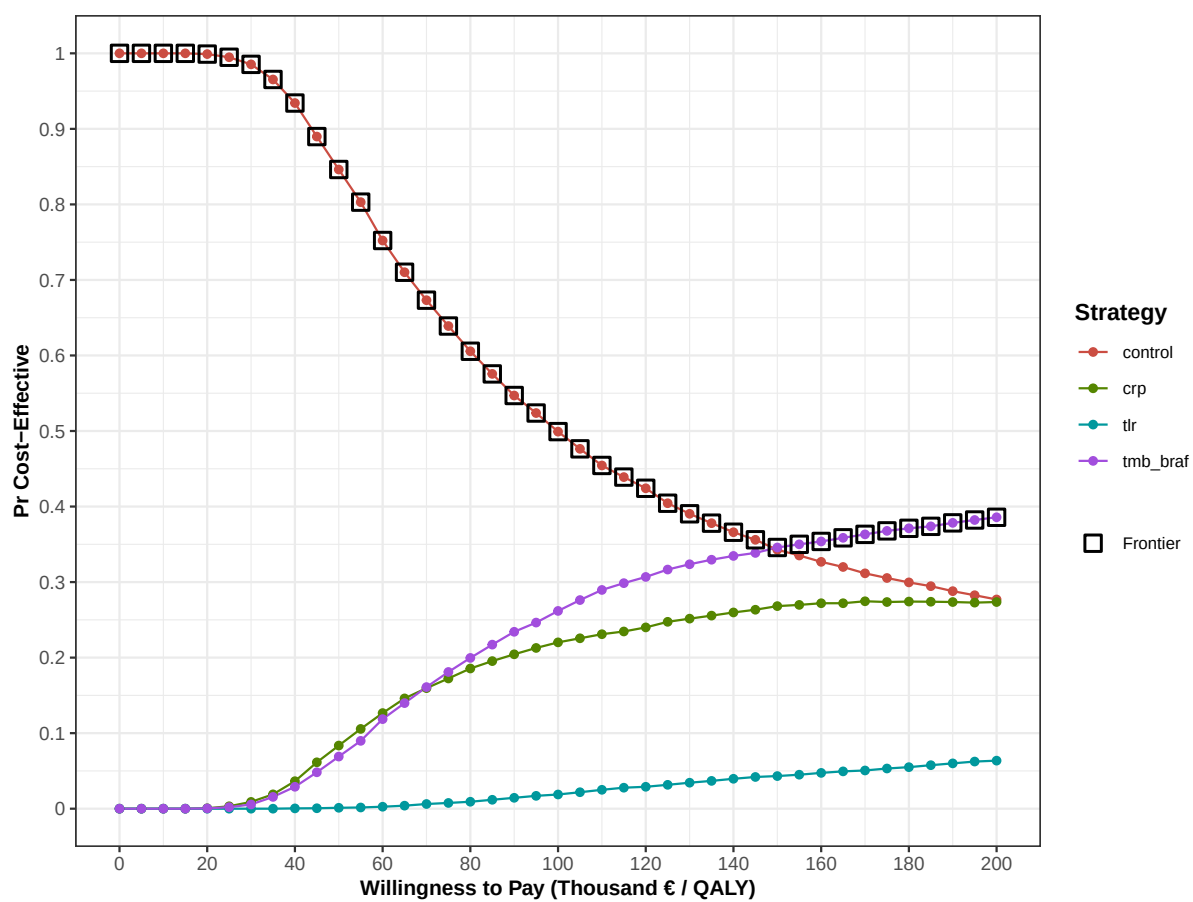

Figure 6: Cost-Effectiveness Acceptability Curve - Scenario 1

4 Scenario 2: Alternative Utility Values ($u_{np} = 0.73$, $u_p = 0.59$)

This scenario examines the cost-effectiveness under alternative, lower utility assumptions that may reflect more conservative estimates of quality of life. They are derived from the EQ-5D index score of the CORRECT trial (Grothey et al. Lancet 2013, as cited by Gourzoulidis et al. J Comp Effect Res 2018)-

Table 7: Utility Parameter Modifications for Scenario 2

Parameter	Base Case	Scenario 2	Difference	% Change
u_{np} (Non-progressed utility)	0.9077	0.73	-0.1777	-19.5770
u_p (Progressed utility)	0.9005	0.59	-0.3105	-34.4808

Beta Distribution Parameters for PSA:

Table 8: Beta Distribution Parameters for Scenario 2 PSA

Parameter	Mean	CV	Alpha	Beta
u_{np}	0.73	0.15	11.270	4.168
u_p	0.59	0.15	17.632	12.253

Table 9: Scenario 2 Cost-Effectiveness Results (Alternative Utilities)

Strategy	Cost	Effect	Inc_Cost	Inc_Effect	ICER	Status
control	\$20,706	1.327	NA	NA	NA	ND

5 Comparative Analysis Across All Scenarios

Table 11: Utility Parameter Values Across Scenarios

Scenario	u_np	u_p	Description
Base Case	0.9077	0.9005	Standard utility values from literature
Scenario 1 (Life Years)	1.0000	1.0000	No quality adjustment (all utilities = 1.0)
Scenario 2 (Alternative)	0.7300	0.5900	Lower/conservative utility estimates

Table 12: Cost-Effectiveness Results Comparison Across Scenarios

Scenario	Strategy	Cost (€)	Effect	NMB (€)
Base Case	Standard of Care	\$20,706	1.844	\$73,357
	CRP-guided	\$54,636	1.784	\$36,373
	TLR-guided	\$84,730	1.704	\$2,164
	TMB/BRAF-guided	\$62,246	1.870	\$33,104
Scenario 1	Standard of Care	\$20,706	2.041	\$83,392
	CRP-guided	\$54,636	1.972	\$45,959
	TLR-guided	\$84,730	1.883	\$11,298
	TMB/BRAF-guided	\$62,246	2.067	\$43,190
Scenario 2	Standard of Care	\$20,706	1.327	\$46,983
	CRP-guided	\$54,636	1.325	\$12,932
	TLR-guided	\$84,730	1.271	-\$19,900
	TMB/BRAF-guided	\$62,246	1.374	\$7,828

Table 13: ICER Comparison Across Scenarios (€ per QALY/Life Year)

Strategy	Base Case	Scenario 1	Scenario 2
Standard of Care	Reference	Reference	Reference
TMB/BRAF-guided	\$1,645,887	\$1,583,045	\$888,196
CRP-guided	Reference	Reference	Reference
TLR-guided	Reference	Reference	Reference

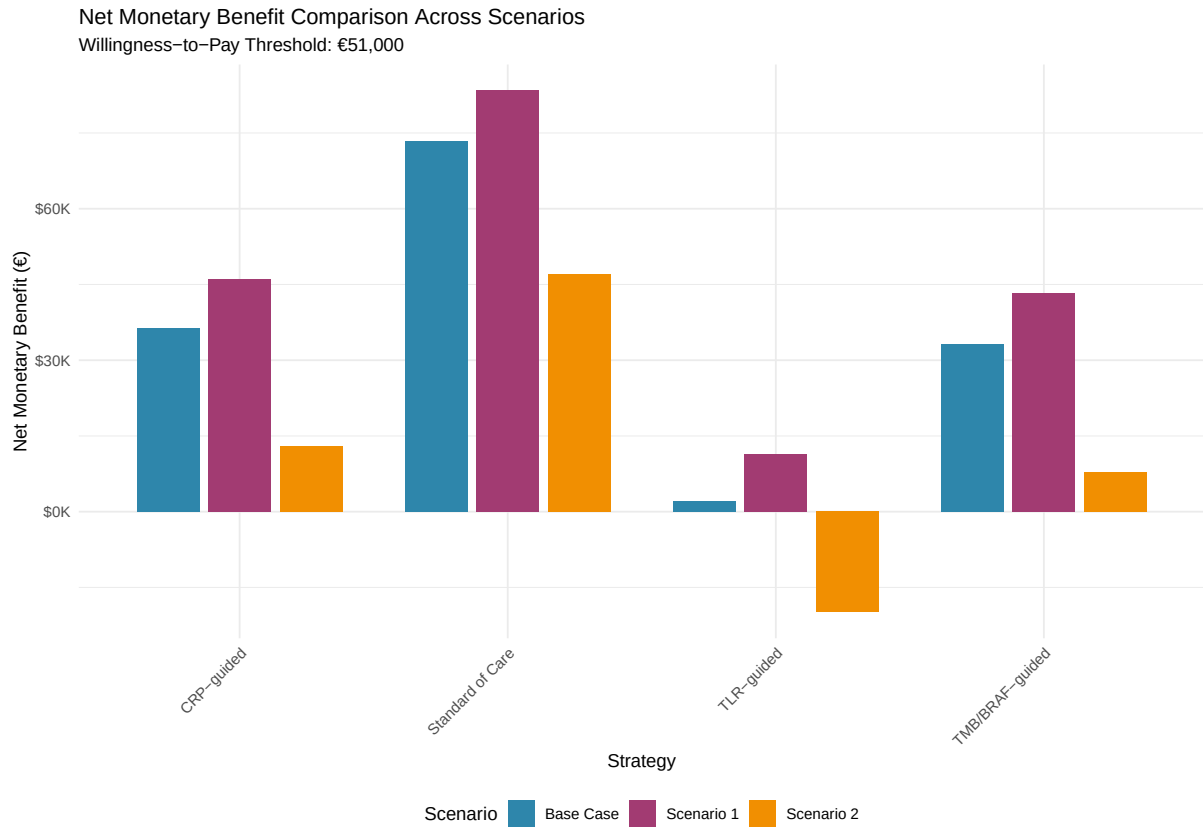

Figure 11: Net Monetary Benefit Comparison Across Scenarios (WTP = €51,000)

Table 14: Optimal Strategy by Scenario at WTP Threshold

Scenario	Optimal Strategy	WTP Threshold
Base Case	Standard of Care	\$51,000
Scenario 1 (Life Years)	Standard of Care	\$51,000
Scenario 2 (Alternative)	Standard of Care	\$51,000

6 Summary

This scenario analysis examined the impact of utility assumptions on the METIMMOX+1 model. The cut-off effectiveness from the base case scatter plot disappears when using alternative values.
