Each comparison below reports the change in base case costs and QALYs, and in net monetary benefit at the willingness-to-pay threshold, from the *before* snapshot to the *after* snapshot. Where both snapshots carry the EVPPI cache (snapshots taken from issue #152 onwards), the per-patient EVPI and the EVPPI table are compared as well; the *after* column includes the Monte Carlo standard error of the regression estimator.

3 Interpretation

This report compares baseline and fixed single-model snapshots for each bug-fix issue that has both, plus a cumulative comparison from the earliest baseline to the latest fixed snapshot. Snapshots are produced by the `13_save_snapshot.R` analysis script (in `scripts/R/analysis/`). If older snapshots contain obsolete multi-model components, `load_snapshot()` warns during render and the tables use the top-level single-model results.
