1 Overview

This one-way sensitivity analysis varies economic parameters by the deterministic sensitivity-analysis range and summarizes the impact on net monetary benefit (NMB). The analysis uses the single joint economic model and the economic strategies returned by `get_strategies()`.

Table 4: Structural sensitivity to parametric survival distribution

Strategy	Base NMB	Lowest NMB	Highest NMB	Range
Standard of Care	EUR 50,996	EUR 42,578 (lognormal)	EUR 53,980 (exponential)	EUR 11,402
CRP-guided	EUR 16,515	EUR 14,973 (gompertz)	EUR 24,105 (exponential)	EUR 9,133
TMB/BRAF-guided	EUR 5,161	EUR 4,053 (gompertz)	EUR 13,556 (exponential)	EUR 9,503

6 Interpretation

The tornado plots and rankings show which parameters drive uncertainty in NMB for the single economic model. Survival distribution sensitivity is shown separately because it reflects extrapolation uncertainty rather than a scalar model input.
