

Biomarker Effect Decomposition

METIMMOX-1 Economic Evaluation

Ben Geisler

2026-06-19

Table of contents

1	Overview	1
2	Biomarker Prevalence	1
3	Restricted Mean Survival	2
4	Survival Decomposition	3
5	Interpretation	3

1 Overview

This report decomposes the survival contribution of the two economic biomarker strategies in the single joint model. Each strategy is shown as biomarker-positive, biomarker-negative, prevalence-weighted, and standard-of-care survival curves.

2 Biomarker Prevalence

Table 1: Economic biomarker prevalences

Biomarker	Prevalence
CRP	33.8%
TMB/BRAF	44.9%

3 Restricted Mean Survival

Table 2: Restricted mean survival by biomarker subgroup and strategy curve

Biomarker	Endpoint	Curve	Years
CRP	Overall survival	Positive	2.65
CRP	Overall survival	Negative	1.91
CRP	Overall survival	Weighted	2.16
CRP	Overall survival	Control	2.31
CRP	Progression-free survival	Positive	2.16
CRP	Progression-free survival	Negative	1.03
CRP	Progression-free survival	Weighted	1.41
CRP	Progression-free survival	Control	0.99
TMB/BRAF	Overall survival	Positive	2.09
TMB/BRAF	Overall survival	Negative	2.21
TMB/BRAF	Overall survival	Weighted	2.16
TMB/BRAF	Overall survival	Control	2.31
TMB/BRAF	Progression-free survival	Positive	1.48
TMB/BRAF	Progression-free survival	Negative	0.93
TMB/BRAF	Progression-free survival	Weighted	1.17
TMB/BRAF	Progression-free survival	Control	0.99

4 Survival Decomposition

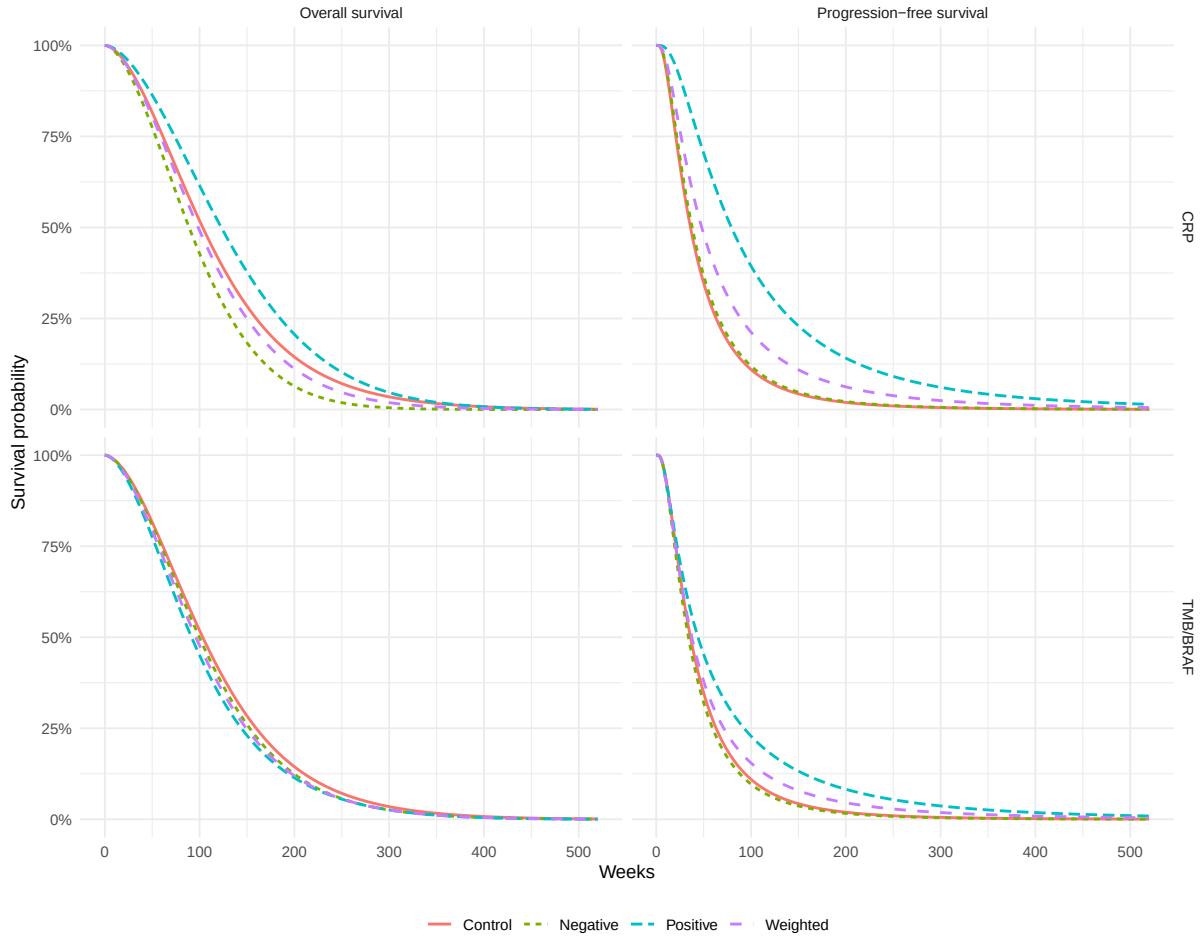

Figure 1: Survival decomposition by economic biomarker

5 Interpretation

The prevalence-weighted strategy curve combines biomarker-positive patients assigned to experimental treatment and biomarker-negative patients assigned to standard care. The distance between the weighted strategy curve and the control curve is the survival component of the economic strategy effect.
